Accelerating the Development of Vaccines and Biologics:
from bench to clinic

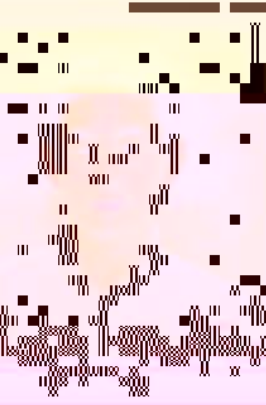

1. Towards the Development of a Cytomegalovirus (CMV) vaccine by Dr. Tongming Fu

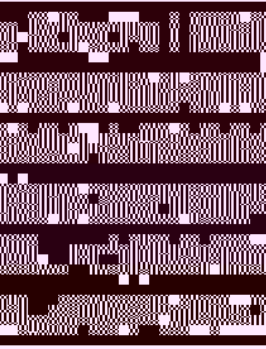

2. Biological Mode of Infection

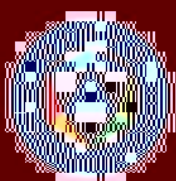

The biological mode of infection for Cytomegalovirus (CMV) involves the virus entering the cell through the cell membrane. The virus then moves towards the nucleus, where it replicates and produces new virus particles. The diagram shows a cell with various organelles and a virus particle entering the cell, interacting with the cell membrane, and moving towards the nucleus.
